

Network Issue Summary - June 29, 2026

Report date: June 29, 2026 (local time UTC+02:00)

Summary:

The logs show intermittent network instability. Most failures were upstream internet losses with the gateway still reachable. A smaller number were local gateway or routing failures, which point to instability between the machine and the router.

Event Table:

Time	Type	Meaning

12:56:13	gateway	Gateway 192.168.2.1 unreachable from WSL. Local path/router issue.
12:57:08	internet	Gateway reachable and DNS OK, but external internet failed.
12:58:38	internet	Gateway reachable and DNS OK, but external internet failed.
12:59:13	internet	Gateway reachable and DNS OK, but external internet failed.
12:59:35	internet	Gateway reachable and DNS OK, but external internet failed.
12:59:45	internet	Gateway reachable and DNS OK, but external internet failed.
13:02:55	internet	Gateway reachable and DNS OK, but external internet failed.
13:03:12	internet	Gateway reachable and DNS OK, but external internet failed.
13:03:34	internet	Gateway reachable and DNS OK, but external internet failed.
13:06:45	routing	Default route disappeared briefly; restored at 13:06:47.
13:09:55	gateway	Gateway unreachable from WSL. Local path/router issue.
13:11:10	internet	Gateway reachable and DNS OK, but external internet failed.
13:11:43	internet	Gateway reachable and DNS OK, but external internet failed.
13:13:34	gateway+dns	Gateway unreachable and DNS timed out; restored at 13:13:36.
13:14:33	internet	Gateway reachable and DNS OK, but external internet failed.
13:15:53	internet	Gateway reachable and DNS OK, but external internet failed.

Overall conclusion:

This is not mainly a clean Wi-Fi adapter disconnect. The WSL interface stayed up most of the time, kept the same IP address, and often still had DNS and the default route. The strongest evidence points to mixed local gateway instability plus repeated upstream internet loss beyond the router.
